

ASTORIUS RESOURCES LTD

Astorius Resources Ltd. is a Canadian public resource company that trades on the TSX Venture exchange under the symbol ASQ. Astorius has one copper and gold exploration project in Western Canada. We continue to look for other opportunities to add to our portfolio.

PROJECTS - The Babine Cu-Au Property, BC

The Astorius Babine Copper-Gold (Cu-Au) property is located in the prolific Babine Lake Porphyry Copper Area, 70 km northeast of Smithers, British Columbia. Astorius owns 100% of the 5,585.76 hectare property and is comprised of 29 claims. The road accessible

property ties onto two former open-pit porphyry Cu-Au deposits, the historic Bell and Granisle Mines owned by Xstrata Canada Corp. which as of July 30, 2013, changed its name to Glencore Canada Corporation.

The Project covers two distinct areas within the Babine Belt; a northern claim block and a southern claim block. The Babine Belt hosts multiple Cu-Au porphyry deposits and showings related to the Eocene-age Babine Igneous Suite, consisting of biotite-feldspar porphyritic (BFP) intrusives. The southern claim block lies within 2 km of two former open-pit porphyry Cu-Au deposits, the historic Bell and Granisle Mines owned by Glencore Canada.

In September 2012, Glencore Canada approached Astorius and asked permission to conduct various geophysical surveys, namely IP and seismic surveys, over portions of Astorius' Babine property. Glencore Canada has provided Astorius with the final report on the results of the survey.

Management believe Astorius' Babine property has several targets that could host important Porphyry Cu-Au Mineralization.

SHARE SUMMARY

Trading Symbols: TSX.V - ASQ
 Shares Issued: 13,560,000
 Options Outstanding: 970,000
 Warrants Outstanding: 1,800,000
 Fully Diluted: 16,330,000

The Bell Porphyry Copper-Gold Mine operated from 1977 to 1992 producing 304,795,539 Kg. of copper, 12,885,964 grams of gold and 38,319,730 grams of silver from 77,146,088 tonnes of ore. The Granisle Porphyry Copper-Gold Mine operated from 1966 to 1982 producing 214,299,455 kilograms of copper, 6,832,716 grams of gold and 69,752,525 grams of silver from 52,321,517 tonnes of ore.

The Morrison Copper-Gold Deposit, is reported to have a proven and probable reserve of 224,250,000 tonnes at an average grade of 0.330% Cu, 0.163g/t Au and 0.004% Mo.

Mines, Deposits & Showings

- The most significant of these are the Bell and Granisle Mines and the Morrison Deposit (see Fig. 3 - summaries showing tonnage and grades)
- The many vein, massive sulphide, and other prospects in the map area indicate that this belt of rocks contains many potential zones for follow-up work.
- Currently, research of available data suggests that there has been little to no regional scale work using modern technologies to properly test the structural corridor.

Exploration

- In 2011, Astorius spent \$150,000 on property work including an airborne geophysical survey.
- This included prospecting and soil sampling of targets defined by the airborne survey, using new technology proven over other porphyry deposits in the region.
- In 2012, Glencore/Xstrata spent \$110,495 to conduct various geophysical surveys, namely IP and seismic surveys, over portions of Astorius mineral claims.
- In 2014, Astorius acquired 111.51 hectares between the Bell and Granisle Mines.
